

Your first 5 × 5 nonograms

3 original Coru puzzles • Pencil-friendly grids

Numbers give consecutive filled blocks, in order: left to right for rows, top to bottom for columns.

Leave at least one empty cell between blocks. A block may touch an edge; other cells are empty.

Fill only cells you can prove. Mark known empty cells with x; leave unknown cells blank.

For example, 2 1 means a block of two, a gap, then one. Start with a clue that fills a whole line.

Answers and starting hints

Match puzzle numbers. Black = filled; × = empty.

Work between rows and columns: after completing a line, mark its remaining cells empty, then check the crossing clues. The hints below give a first step; the grids show full answers.

1

Row 3 and column 3 both have clue 5: fill all five cells in each.

3

2

Row 2 has clues 1, 1, 1. Three filled cells plus two required gaps use all five cells: fill columns 1, 3 and 5.

A block of 3 in a five-cell line always covers its middle cell. Fill two cells: (row 1, column 3) and (row 3, column 4).
